# INFRASTRUCTURE MIGRATION

## Invest in Transformation

1. Best platform for the future; PLUS
2. Re-invest savings into transformation initiatives, such as management, automation, or containers.

## Cost savings

Typical cost savings of 40-50% over 3 years over long-term commitments with proprietary virtualization.

## Proven methodology

Proven methodology to architect, automate, and execute large-scale, mission critical workload migrations.

# INFRASTRUCTURE MIGRATION STRATEGY

## Three aspects to successful migration

### Planning and platform setup

- Define approach and architecture
- Operationalize alternative platform
- Identify and characterize VMs for migration

### Migration tooling and approach

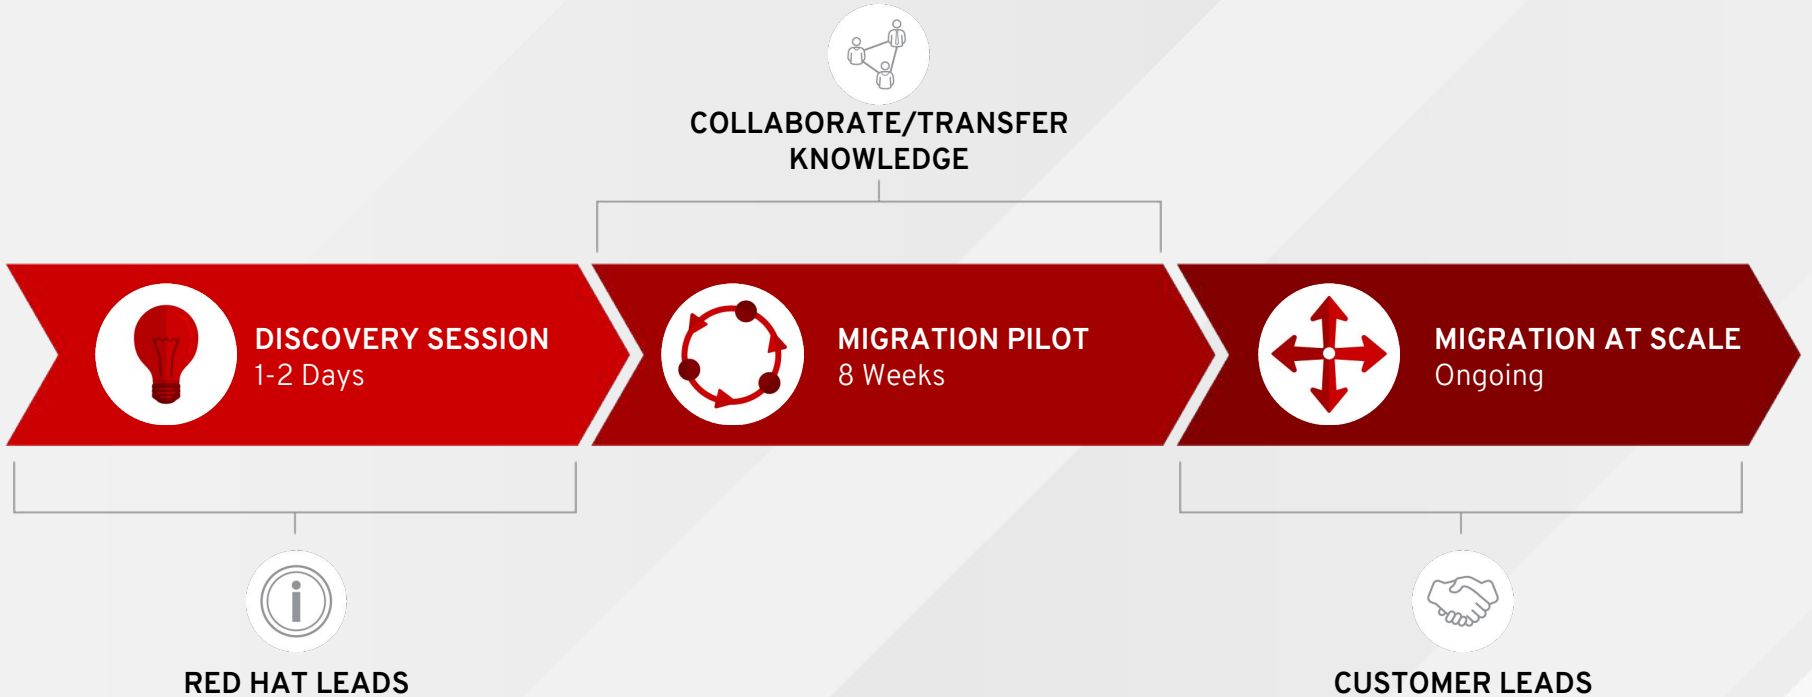

- Jointly develop comprehensive tooling and approach for migrating workloads with key stakeholders to ensure success

### Migration execution

- Validate and refine migration approach
- Pilot migration of a representative set of workloads
- Set the stage to migrate thousands of workloads with a strategic approach and proven tools

“

As we look to the future, it was imperative that we be able to bring IT automation to all aspects of our business, and that our infrastructure was flexible enough to do so. After many considerations, an open source environment was the best option to support our needs. Red Hat has helped us in this transition, providing solutions with an automation-centric approach in mind that have helped to streamline operations and cut costs.

For its 18th code release, issued today, the [OpenStack](#) community is making the software easier to deploy on bare metal. The release, named "Rocky," takes advantage of the way physical servers are managed to make it as fast and easy to deploy OpenStack on physical servers as in [virtual machines](#) (VMs).

VIRTUALIZATION

## Why migrate your virtual infrastructure to Red Hat?

A decision like this isn't just about infrastructure. It's about what your infrastructure can (or can't) do to support the technologies you want to deploy. It's the difference between choosing the right software for the situation or weighing the tradeoffs of complying with an increasingly expensive enterprise license agreement (ELA).

*Think about it like this:*

Imagine you're an IT architect building your infrastructure on proprietary virtualization technology. When your company is ready to adopt new technologies like hybrid cloud and containers, you're limited to either what's compatible with the vendor's virtual infrastructure or time-intensive workarounds.

With a vision of the future, your developers cobble together a system—but each iteration is more complicated than the last. To keep everything working, your system administrators are often in the office on weekends troubleshooting system failures or rewriting patches and updates. And you start to realize that the next licensing agreement you sign will take away even more money you could have invested in modern products and solutions.

*On the other hand:*
